Design of a Sounding Rocket

Lesson 3: Aerodynamic Design of Sounding rockets

李易 博士

Dr.-Ing LI Yi

School of Astronautics

Forces acting on the rocket

Weight, Thrust, Drag, Lift

Sounding rocket: uncontrolled

Aerodynamic forces: **Lift** and **Drag**

Aerodynamic forces: **Pressure** and **Friction**

Source: NASA

Earth Atmosphere

1. The missions of aerodynamic design

Sounding rocket: uncontrolled

- Stable flight
- Protect the rocket from aerodynamic loads, heating loads...
- Low cost (low drag)

2. Aerodynamic design of sounding rockets

Normal configurations of sounding rocket

Center of Pressure

Low Angle

High Angle

Pressure Variation

Aerodynamic Force

Center of Pressure

Moving Fluid

Center of Pressure is the average location of the pressure.
Pressure varies around the surface of an object. $P = P(x)$

$$C_P = \frac{\int x \cdot p(x) \cdot dx}{\int p(x) \cdot dx}$$

Aerodynamic force acts through the center of pressure.
Center of pressure moves with angle of attack.

Source: NASA

Determine Center of Pressure

Each component has some area a_i
located some distance d_i from reference line.

Distance cp times the area A equals the sum of the
component distance times area.

$$cp A = d_n a_n + d_b a_b + d_f a_f$$

2. Aerodynamic design of sounding rockets

Head configurations

Drag: Wave drag and friction drag

Head: conic or parabolic

More L/D (length/diameter) less drag

Subsonic flight: parabolic head is preferred

Supersonic flight: conic head is preferred

2. Aerodynamic design of sounding rockets

Head configurations

For supersonic flight, skin friction drag and base drag are relatively small. Supersonic drag is dominated by the drag due to the shock wave on the nose.

$$(CD_0)_{Body, Wave} = 3.6 / [(l_N / d)(M^2 - 1) + 3]$$

$$(C_{D0})_{\text{Body, Wave}} = 3.6 / [(l_N / d) (M - 1) + 3], \text{ if } M > 1 \text{ and } (C_{D0})_{\text{Body, Wave}} = 0, \text{ if } M < 1$$

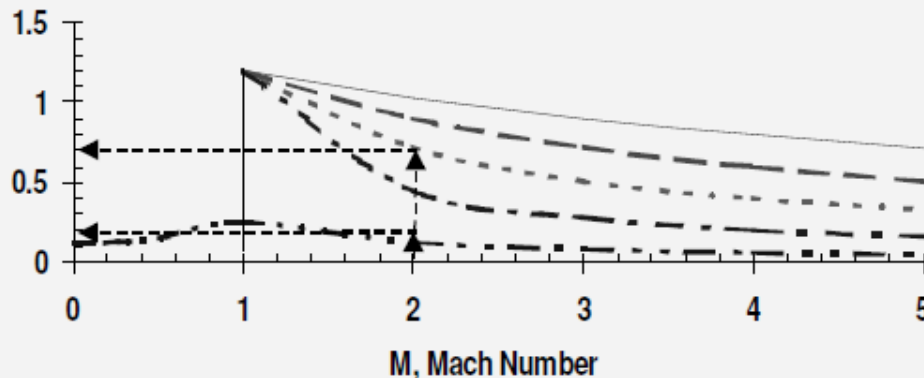

$$(C_{D0})_{\text{Base, Coast}} = 0.25 / M, \text{ if } M > 1 \text{ and } (C_{D0})_{\text{Base, Coast}} = (0.12 + 0.13 M^2), \text{ if } M < 1$$

$$(C_{D0})_{\text{Base, Powered}} = (1 - A_e / S_{\text{Ref}}) (0.25 / M), \text{ if } M > 1 \text{ and } (C_{D0})_{\text{Base, Powered}} = (1 - A_e / S_{\text{ref}}) (0.12 + 0.13 M^2), \text{ if } M < 1$$

$$(C_{D0})_{\text{Body, Friction}} = 0.053 (l / d) [M / (q l)]^{0.2}$$

$$(C_{D0})_{\text{Body}} = (C_{D0})_{\text{Body, Wave}} + (C_{D0})_{\text{Base}} + (C_{D0})_{\text{Body, Friction}}$$

Note: $(C_{D0})_{\text{Body, Wave}}$ = body zero-lift wave drag coefficient, $(C_{D0})_{\text{Base}}$ = body base drag coefficient, $(C_{D0})_{\text{Body, Friction}}$ = body skin friction drag coefficient, $(C_{D0})_{\text{Body}}$ = body zero-lift drag coefficient, l_N = nose length, d = missile diameter, l = missile body length, A_e = nozzle exit area, S_{Ref} = reference area, q = dynamic pressure

— (CD0)Body, Wave; $l_N / d = 0.5$ — — (CD0)Body, Wave; $l_N / d = 1$
 - - - (CD0)Body, Wave; $l_N / d = 2$ — - (CD0)Body, Wave; $l_N / d = 5$
 — — (CD)Base, Coast

Example for Rocket Baseline:

$$(C_{D0})_{\text{Body, Wave}} \quad (C_{D0})_{\text{Body, Friction}} \quad (C_{D0})_{\text{Base}}$$

$$f_N = l_N / d = 2.4, A_e = 11.22 \text{ in}^2, S_{\text{ref}} = 50.26 \text{ in}^2, M = 2, h = 20\text{K ft}, q = 2725 \text{ psf}, l / d = 18, l = 12 \text{ ft}$$

$$(C_{D0})_{\text{Body, Wave}} = 3.6 / [2.4 (2 - 1) + 3] = 0.67$$

$$(C_{D0})_{\text{Base Coast}} = 0.25 / 2 = 0.13$$

$$(C_{D0})_{\text{Base Powered}} = (1 - 0.223) (0.25 / 2) = 0.10$$

$$(C_{D0})_{\text{Body, Friction}} = 0.053 (18) \{ (2) / [(2725) (12)] \}^{0.2} = 0.14$$

$$(C_{D0})_{\text{Body, Coast}} = 0.67 + 0.13 + 0.14 = 0.94$$

$$(C_{D0})_{\text{Body, Powered}} = 0.67 + 0.10 + 0.14 = 0.91$$

The shape of an object has a very great effect on the amount of drag.

$$C_d = \frac{D}{\frac{1}{2} \rho A V^2}$$

A = frontal area

Almost factor 30 better than the flat plate!

All objects have the same frontal area.
